

What to expect on your cabling installation:

Hubbell Patch Panels with Panduit Wire Management Single Sided

Why Hubbell? Hubbell Patch Panels (48 Port) put the labeling in the middle of the panel. This allows us to patch up on the top row and patch down on the bottom row into the wire management. Your labels remain exposed and so you can see where everything is after it is patched in. You will appreciate how easy it is to make your own changes.

=NEAT INSTALL & EASY MANAGEMENT

Back side of 48 port Hubbell Patch Panels with CAT5e or CAT6 wiring

What does CT Solutions do so well?

Notice the short amount of cabling exposed outside of the cabling jacket. CT Solutions will keep your CAT5e or CAT6 cables twist intact so you can optimize the speed of your cable.

=SPEED & NEAT INSTALLATION

Wiring running up from Floor Rack along ladder into the ceiling

All cables from the patch panels, the rack and into the ceiling are labeled, securely fastened and dressed neatly on every job as if it were done in our own office. **Before the cables are pulled, they are chronologically numbered in sequence at the jack.** This extra work will make sure your numbering scheme is consistent along the offices. Most of our competition does not do this because of the extra labor involved. (Ex: not having V31 next to D4 etc. on the jack)
